Are excessive admin rights causing organizations more harm than they realize?

Breach techniques 2020

In 2020, abuse of admin rights and similar privileges was the top reason behind breaches.

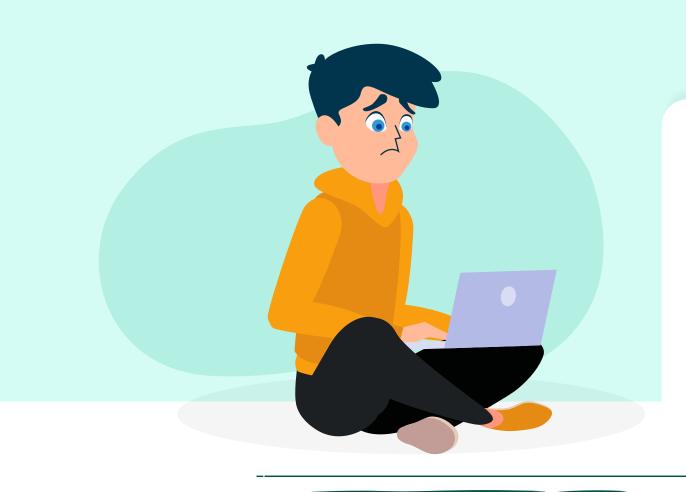

> **Removing admin rights** would mitigate 70 percent of Critical vulnerabilities affecting

Windows 7, RT, 8, 8.1, and

58 percent of all Critical **Microsoft vulnerabilities** that were found in 2020 could be mitigated by removing admin rights.

<u>10.</u>

But how can organizations get rid of admin rights without taking away privileges from employees whose job requires them?

It's easy! Adopt this simple three-part strategy.

Principle of least privilege +

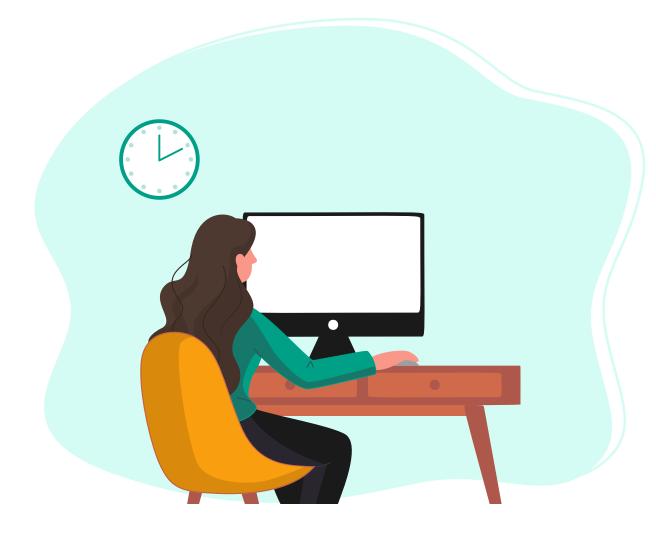

Lower enterprise-wide privileges to the bare minimum required. Identify and remove unnecessary local admin accounts.

Endpoint privilege management

Elevate application-specific privileges instead of user privileges, and associate these rights to necessary end-user device groups.

Just-in-time access +

Cater to temporary needs of employees without creating permanent policies. Strike the perfect balance between security and productivity.

Application Control Plus is a silver bullet that seamlessly combines these three capabilities.

What's more? This software also offers integrated application control features that enable trust-based filtering and restriction of applications that are allowed to execute, ensuring that only authorized access is granted to network resources.

Application Control Plus acts as a multifaceted engine that enables organizations of all sizes and modes of operation to tailor a fortified foundation based on powerful security principles like Zero Trust and the principle of least privilege.
