ManageEngine
EventLog Analyzer MSSP

EventLog Analyzer MSSP Edition
Enabling MSSPs to deliver world-class security services

MSSP EDITION FEATURES:

- Automated discovery
- Agentless or agent-based log collection
- Network device monitoring
- Simplified IT compliance reporting
- AWS infrastructure monitoring
- Real-time event log correlation
- A built-in ticketing system to assign incidents
- Role-based access control
- Over 1,000 predefined report templates and alert profiles
- Simple and straightforward pricing: Only pay for what you monitor

OPTIONAL ADD-ONS

- Application auditing (IIS, MS SQL, etc.)
- File integrity monitoring
  - ◆ Linux file server auditing
  - ◆ Windows file server auditing
- Advanced threat analytics

> The best thing I like about the application is the well-structured GUI and the automated reports. This is a great help for network engineers to monitor all the devices in a single dashboard. The canned reports are a clever piece of work.

Intuitive admin dashboards for multi-client management

EventLog Analyzer MSSP gives you a 360-degree view into what's happening in each of your clients' networks. You can install the product on each of your client's servers, and build instant reports directly from the admin console. Customizable dashboards for each customer allow you to choose the metrics you want to monitor for a particular client's environment.

### Mitigate the impact of potential attacks

The real-time correlation and alerts feature of EventLog Analyzer MSSP can help you configure which devices need to be monitored, and send you real-time notifications through email or SMS. Choose from over 500 predefined alert criteria and categorize them into three levels of priority based on the event: high, medium, or low.

You can also conduct extensive incident investigation using the MITRE ATT&CK tactics, and expedite effective threat resolution with automated incident workflows.

A flexible solution = predictable pricing

As the number of customers you support varies, you need security tools that can easily let you scale up or down, allowing you to implement the necessary tools that can support the anticipated growth.

Eventlog Analyzer has a straightforward pricing model based on the number of devices you want to monitor and the add-ons you choose. This lets you build a scalable architecture, have multi-geographical monitoring capabilities, and track the events happening on each customer's servers.
