ManageEngine integrates Intel DCM to reduce data centre energy usage

ManageEngine, the real-time IT management company, has launched the Intel DCM Energy Management plug-in for RackBuilder Plus, its 3D visual modeling software for data centres.

As a result of leveraging Intel Data Center Manager (Intel DCM), the new plug-in lets admins know the power usage and temperature of their data centre floors, racks and devices.

Up to 60% of a typical data centre utility bill goes to cooling systems. Considering

the huge size of today's data centers, those bills can run up to thousands of dollars over years.

Designing a real-time, continuous energy monitoring system that works in tandem with DCIM visualisation tools can help reduce these bills.

"Our partnership with Intel brings together leading-edge capabilities in energy monitoring and DCIM visualisation," said Dev Anand, Director of Product Management at ManageEngine.
