

ONE-STOP SHOP

For more than 35 years, Pivot Engineering has served the UAE with a growing portfolio of engineering and contracting services. To enhance its IT efficiency and create a one-stop centralised communication platform for employees, the company opted to implement an array of fresh products at its head office in Abu Dhabi.

Established in 1978, Pivot Engineering and General Contracting has been helping customers across the UAE transform ideas on paper into tangible assets of real value for the last 35 years. Pivot's portfolio of completed and current projects demonstrates a wide range of construction, including villa compounds, high-rise towers, hotels, malls and even oil and gas installations.

Among some of the company's most notable completed projects are The Diwan of His Highness the Crown Prince of Abu Dhabi and the Lulu Hypermarket in Al Barsha, Dubai, while the company are currently working on the AKOYA villas by DAMAC Properties.

The foundation of each project, according to the company vision, is based upon reliability, certainty

and excellence from the entire Pivot team, comprising 5,000 employees including civil engineers, quantity surveyors and quality engineers.

In order to enhance the relationship between these various company departments, which in turn would increase the efficiency of operations and completion of projects, Pivot sought to implement a centralised IT platform at its Abu Dhabi head office.

IT holds particular importance in the construction sector, says the company's IT manager, Aytek Adogan. "It's a major aspect of our day-to-day operations," he says. "Prior to the implementation of the any new products, our tracking capabilities of project completions and asset management were limited to Excel spreadsheets. This was not beneficial to myself as a manger or for

my technicians, as we were unable to detect reports and analyse data on a real-time basis."

A major limitation with the previous method of operation was that an Excel sheet could be centralised, and therefore could not be opened by more than one person at a time. This caused several challenges for the company when trying to control the opening and closing of construction sites, and track the availability of resources.

Since Adogan joined Pivot in 2015, various changes have been implemented in order to tackle these issues. "I needed to understand how my team was performing, by measuring and monitoring what they were doing from a manager's point of view," he says.

The company adopted ManageEngine's Service Desk Plus

I needed to understand how my team was performing, by measuring and monitoring what they were doing from a manager's point of view.

- an ITIL ready service desk with a configuration management database (CMDB), which has given Adogan great visibility and central control over the company's IT infrastructure.

"Service Desk Plus allows us to now receive all incidents from individual users into one centralised base. We have established a centralised help desk at our Abu Dhabi office that serves our users, and if someone in the company has an issue that requires the help of the IT team, they can now access our assistance through Service Desk Plus," says Adogan.

The software's request and incident management capabilities have been the most beneficial to Adogan and his team. "The service means that we are now very accountable as an IT team, as each response to an incident is reported and logged, meaning I can effectively monitor the progress of each request and detect any delay in responses," he says. "We also do not have IP phones at all of our sites, but this is no longer an issue as the team can communicate via this centralised platform."

The software relays information from asset management, service requests and problem solving in order for Adogan to get a complete understanding of IT operations

within the company. It has also enabled Adogan to oversee employee availability through the software's calendar feature. "This feature has been particularly useful, as it helps me focus on how many people I should assign to each resource. It has meant my people accountability has been enhanced, which is very beneficial for me as a manager," he says.

In addition to Service Desk Plus, Pivot is in the process of completing the installation of ManageEngine's UEM Central, which is a web-based server equipped with desktop and mobile device management software. This also operates from a centralised location, and enables Adogan to extend the IT department's reach to various locations via the software's remote desktop support.

"For example, if an employee was at a site in Al Ain, this application helps us reach out to them, and allows my help desk engineer to assist them with any issues they may have," he says. "UEM Central also provides us with remote installation capabilities, so not only can we control and monitor our users' PCs, but we can also remotely control and deploy applications, patch systems and efficiently maintain our environment."

The deployment of both applications – which took place at the beginning of 2017 – was successful and stress-free, according to Adogan. "My experience with ManageEngine has been great," he says. "We have had fantastic support from Elitser, their distributor here in the region. Both applications were deployed within a week, and the process was both seamless and fast-moving, with no issues at all."

Since Adogan's posting in 2015, he has led various changes within Pivot's IT department, including the virtualisation of 25 servers to four individual blade servers, as well as implementing an ERP project that is now successfully up and running.

Looking ahead to the coming twelve months, Pivot's next steps include implementing a business intelligence reporting solution for the benefit of the board and managerial departments. "This installation would be part of the management systems rather than the IT department, but it will create a centralised platform for the board to have clearer visibility when making managerial level decisions," he says. "We hope to have this implemented by the end of 2017, before we begin to look at disaster recovery and cloud computing as the next steps." ■
