Password Manager Pro

One Product,
Three Solutions

- Privileged account management
- Remote access management
- Privileged session management

Centralized vault

Discover and store all your passwords and SSH keys into one secure repository.

Password release control workflows

Granular access controls with request-release workflows for password retrieval.

Automated password resets

Automated resets for administrator and root account passwords, hard-coded passwords, service account passwords, and SSH keys.

First-in-class remote access

Launch secure RDP, SSH, and SQL database sessions directly from Password Manager Pro.

Auditing and compliance reporting

Comprehensive audit trails of all user operations. Out-of-the-box compliance reports for PCI DSS, ISO/IEC 27001, and NERC-CIP.

Session recording and shadowing

Record and archive privileged sessions for auditing needs. Shadow sessions in real time to monitor user activity.

Policy enforcement

Password policies to enforce strong passwords, periodic rotation, and granular access controls.

AD/LDAP integration

Integrate with corporate identity stores such as AD, LDAP and RADIUS services for user provisioning and authentication.

Certificates, documents, and web accounts

Safely store SSH keys, digital certificates, license files, and documents.

SIEM integration

Provide privileged access data to event management tools for a holistic insight on internal or external threats.

Mobile access

Access passwords while on the go using native apps for iOS, Android and Windows.

Real-time alerts and notifications

Configure instant notifications to desired recipients on the occurrence of specific password events.

Automatic login to websites and applications

Launch automatic connections to websites using browser extensions (Chrome, Firefox and Internet Explorer)

Ticketing system integration

Integrate Password Manager Pro with help desks and sanction service requests related to privileged access with valid ticket IDs.

Two-factor authentication

Enforce two successive stages of authentication for users before password retrieval.

High availability

Get uninterrupted access to critical passwords through redundancy and automatic failover with SQL server clustering.
