

Stop sensitive data from leaving your endpoints with Endpoint DLP Plus

An endpoint data loss prevention solution that discovers, classifies, and enforces boundaries on sensitive data, helping protect your windows devices against insider and external threats across every endpoint.

The Endpoint DLP Lifecycle

Discover

- Scan all endpoints for sensitive data
- Identify PII, financial records, confidential files
- Classify by sensitivity level
- AI + rule-based detection

Define

- Granular DLP policies by user, role, or device
- Control how data moves and who accesses it
- Auto-deploy to all endpoints

Detect

- Monitor USBs, browsers, cloud, apps, email
- Inspect file content, not just names
- Track renamed or compressed files
- OCR for images and scanned docs

Respond

- Real-time alerts with full context
- Auto-block at the point of action
- Timestamped audit logs for compliance

Core Capabilities

Data Discovery & Classification

Automatically locate sensitive data at rest, in motion, and in use across all endpoints using ML-based detection and context-based classification. Supports hundreds of predefined templates spanning healthcare, finance, legal, and other regulated industries, alongside custom templates including regex patterns, keyword matching, document matching and file extensions to simplify compliance and policy enforcement.

Device & Peripheral Control

Manage and restrict USB drives, removable media, printers, and peripheral devices with granular, role-based policies to prevent unauthorized data transfers without disrupting legitimate workflows.

Cross-Channel Data Loss Prevention

Reduce data leakage across multiple exfiltration channels by preventing sensitive content from being attached to emails, uploaded to unauthorized web applications and cloud storage, or transferred through other unauthorized destinations, shutting down shadow IT and data exfiltration paths.

Data Containerization & Clipboard Protection

Confine sensitive data to enterprise approved applications, block transfers to unauthorized destinations, and limit clipboard and screen capture actions to prevent silent data exfiltration.

OCR Detection & Content-Aware Inspection

Inspect actual file content not just names or formats, track sensitive data even when renamed, compressed, or reformatted. Detect sensitive information embedded in images and scanned documents for common file types

Reporting, Audit & Incident Response

Receive instant breach notifications with complete incident context (who, what, when, where), automatically block unauthorized transfers at the point of action, and generate comprehensive reports with sensitive email and file audit trails, timestamped logs, and evidence for compliance, investigations, and regulatory reporting.
