ManageEngine deploys Intel DCM

ManageEngine **has** launched the Intel DCM Energy Management plug-in for RackBuilder Plus, its 3D visual modelling software for data centers. The new plug-in lets admins know the power usage and temperature of their data center floors, racks and devices. Up to 60 percent of a typical data center utility bill goes to cooling systems. "Our partnership with Intel brings together leading-edge capabilities in energy monitoring and DCIM visualization. Intel's energy manager is now available as a plug-in for our RackBuilder Plus to help admins get the heat map view of their racks, apply power capping over energy-intensive equipment, measure and report on energy metrics such as PUE and conduct energy audits periodically," said Dev Anand, Director of Product Management, ManageEngine.
